

Day 1 : Use of SQL, Python and Zohosheet for Data Analysis

Objective/Goal:

“The goal was to understand revenue performance across regions and identify which product categories are driving sales.”

Approach:

I analyzed order data by combining it with product category information and then evaluated revenue across regions and categories.

Key Findings:

I found that Assam has the lowest overall revenue among all regions. Additionally, revenue across regions is concentrated in a few key product categories.

Interpretation:

The lower revenue in Assam is primarily driven by a lower number of orders rather than lower value per order, which suggests a demand or market reach issue rather than a pricing problem.

Recommendation:

To address this, I would recommend focusing on increasing order volume in Assam through improved marketing efforts or expanding delivery reach.
