

Day 1 : Use of SQL, Python and Zohosheet for Data Analysis

Objective/Goal:

The goal was to identify which regions perform best for different product categories such as furniture and spices.

Approach:

I analyzed revenue across regions by product category to understand which areas contribute the most to each category.

Key Findings:

I found that Ahmedabad and Mumbai generate the highest revenue for furniture-related products, indicating strong performance in that category.

Interpretation:

This could be due to factors like availability of raw materials, skilled labor, and strong export demand, especially in international markets.

Recommendation:

Based on this, similar regions could focus on developing supply chains and capabilities in furniture production to improve their export potential.
